Ideation Phase

Brainstorm and Idea Prioritization

Date	02 October 2026
Team ID	SWTID-2026-5170
Project Name	Script-Controlled ACL – Restrict Record Access Based on Custom Script
Maximum Marks	4 Marks

Step 1: Team gathering, collaboration and problem selection

The team met to discuss how sensitive records in a ServiceNow instance can be protected. Out-of-the-box ACLs only check roles and simple conditions. The team chose to explore **script-controlled ACLs**, where a custom script decides whether access is granted.

Step 2: Brainstorm and idea listing

#	Idea	Brief description
1	Role-only ACLs	Allow or deny access purely by assigning roles to users.
2	Condition-based ACLs	Use the ACL condition builder on a single field value.
3	**Script-controlled ACLs**	Use a script that checks field values and the logged-in user before returning true or false.
4	Data policies / UI policies	Hide or lock fields on the form only (client-side).
5	Business-rule filtering	Use a query business rule to filter lists.
6	Domain separation	Separate data by domain for each department.

Step 3: Idea prioritization

Each idea was scored from 1 (low) to 5 (high) on impact, feasibility and effort saved.

Idea	Impact	Feasibility	Flexibility	Total	Decision
Role-only ACLs	2	5	1	8	Baseline only
Condition-based ACLs	3	5	2	10	Use partly
Script-controlled ACLs	5	4	5	**14**	**Selected**
Data / UI policies	2	4	2	8	Not enough
Business-rule filtering	3	3	3	9	Not selected
Domain separation	4	2	2	8	Out of scope

Outcome: Script-controlled ACLs were selected because they give full control over who can read, create, write and delete a record, based on field values and user conditions, and run on the server where they cannot be bypassed from the browser.
