Project Design Phase

Proposed Solution Template

Date	02 October 2026
Team ID	SWTID-2026-5170
Project Name	Script-Controlled ACL – Restrict Record Access Based on Custom Script
Maximum Marks	2 Marks

S.No.	Parameter	Description
1	Problem statement (problem to be solved)	Role-based ACLs give users access to every record in a table. They cannot restrict records by owner, status or confidentiality, so sensitive data can be seen or changed by unauthorised users.
2	Idea / solution description	Create script-controlled ACLs on a custom table for Read, Create, Write and Delete. Each script checks field values and user conditions and sets *answer* to true only when access is allowed.
3	Novelty / uniqueness	One script combines roles, record ownership and field values for fine-grained control, using only built-in ServiceNow features and no external tools.
4	Social impact / customer satisfaction	Protects confidential data, builds user trust and reduces the risk of accidental or malicious changes.
5	Business model (revenue model)	Internal security and compliance model. It lowers the cost of data breaches and audit effort.
6	Scalability of the solution	The same pattern can be applied to any table, any number of records and any additional roles by changing the script conditions.
